Profile	12+ years of hands-on quantitative research, the last 7 building and validating ML pipelines on large imaging and longitudinal datasets going from raw acquisition to reproducible, decision-ready models. Currently benchmarking pathology foundation models with external-cohort validation. Builds the pipeline, runs the analysis, defends the answer and makes the capability stick.	
Experience	2026-present	Medical imaging AI — FineTuned Path (2026, self-driven) Benchmarking pathology foundation models (H-optimus-o vs. ImageNet ViT control) for 9-class colorectal tissue classification: linear probes on frozen embeddings, external-cohort validation (NCT-CRC-HE-100K to validate CRC-VAL-HE-7K), LoRA adaptation and stain-robustness audits in progress.
	2025-present	Image Analysis scientist (AI-driven computational analyst), ISTA - Image analysis consultant for 500+ researchers: resolved ~250 analysis requests in a year, mentoring junior scientists and graduate students, from experimental design to data architecture. - Translated open-ended research questions into scoped analyses and shipped 5+ ML pipelines (instance segmentation, CNN classification) to 8+ groups via sprint-based Kanban delivery with Pixi environments, Git-versioned code and CI testing: so the groups now run them independently.
	2018-2025	Graduate Research Project, ISTA - Longitudinal modelling: Extracted developmental biomarkers as time series across thousands of timepoints from irregularly sampled imaging data and modelling their dynamics to resolve the timing and rate of state transitions (Python: pandas, numpy, scipy, scikit-learn; HPC clusters). - Built the shared data standards and parallelised processing pipeline that consolidated 40+ TB of primary experimental data across 4 labs into one analysable dataset, with the full analysis and every paper figure regenerable from raw data in under 6 hours. - Conceived and led a 3-institution, 4-lab study (7 co-authors, 3 countries, 2.5 years) delivering a first-author Nature Communications publication (Naik et al., 2026). - Co-authored the €500K FWF grant application with my PI and won €300K in competitive PhD funding (FWF DK NanoCell doctoral programme; Horizon 2020 Marie Skłodowska-Curie fellowship). Invited speaker at European Intermediate Filaments 2023 (NL) and Gordon Research Conference on IFs, Spain (Best Speaker Award).
	2012-2017	Undergraduate and Master's Research in Biology; CNRS, France and IISER Pune, India - Led a 3-lab crossfunctional study across 2 continents producing a first-author article in The Journal of Experimental Biology (Naik et al., 2020). - Won CNRS International Master's Research funding, plus KVPY (all-India rank 8) and INSPIRE (top 1%) national fellowships.
Leadership	2019-2024	Team Lead: PhD Balance Social Media Team Led a 25k-follower global NGO social media team of volunteers for 5 years growing the audience 4,000+ followers annually across 500+ posts.
	2019-2023	Founding Organizer: Young Science Seminar and Connecting Intermediate Filaments seminar
Education	2018-2025	PhD in Biology and Physics (thesis in biophysics, quantitative imaging, and modelling) ISTA
	2012-2017	Integrated BS-MS in Biology and Mathematics , Indian Institute of Science Education and Research Pune, India
Languages	German (B1, advancing), English (C2), Hindi and Marathi (native)	
Skills	Web: reproducible analysis reports and project sites built in Quarto and hand-written HTML/CSS, deployed via GitHub Pages; scientific figures + explanatory graphics (Illustrator) that make complex results legible to non-specialists. Pipelines and Infrastructure: containerised, reproducible ML pipelines (Docker, pixi/uv, Git/CI, automated testing); HPC/SLURM at 40+ TB scale; object storage and self-hosted service stacks; GitHub Actions automation. Cloud-portable by design — building on managed cloud (GCP/AWS) is the next step, not a new paradigm.	
Hobbies	Biomedical tracking: Built and maintain a multi-year longitudinal dataset with data from my biking and hiking
